

Analysis and Classification of EEG Data

Elia Rizzo

20/11/2024

Digitalcity.brussels

Outline

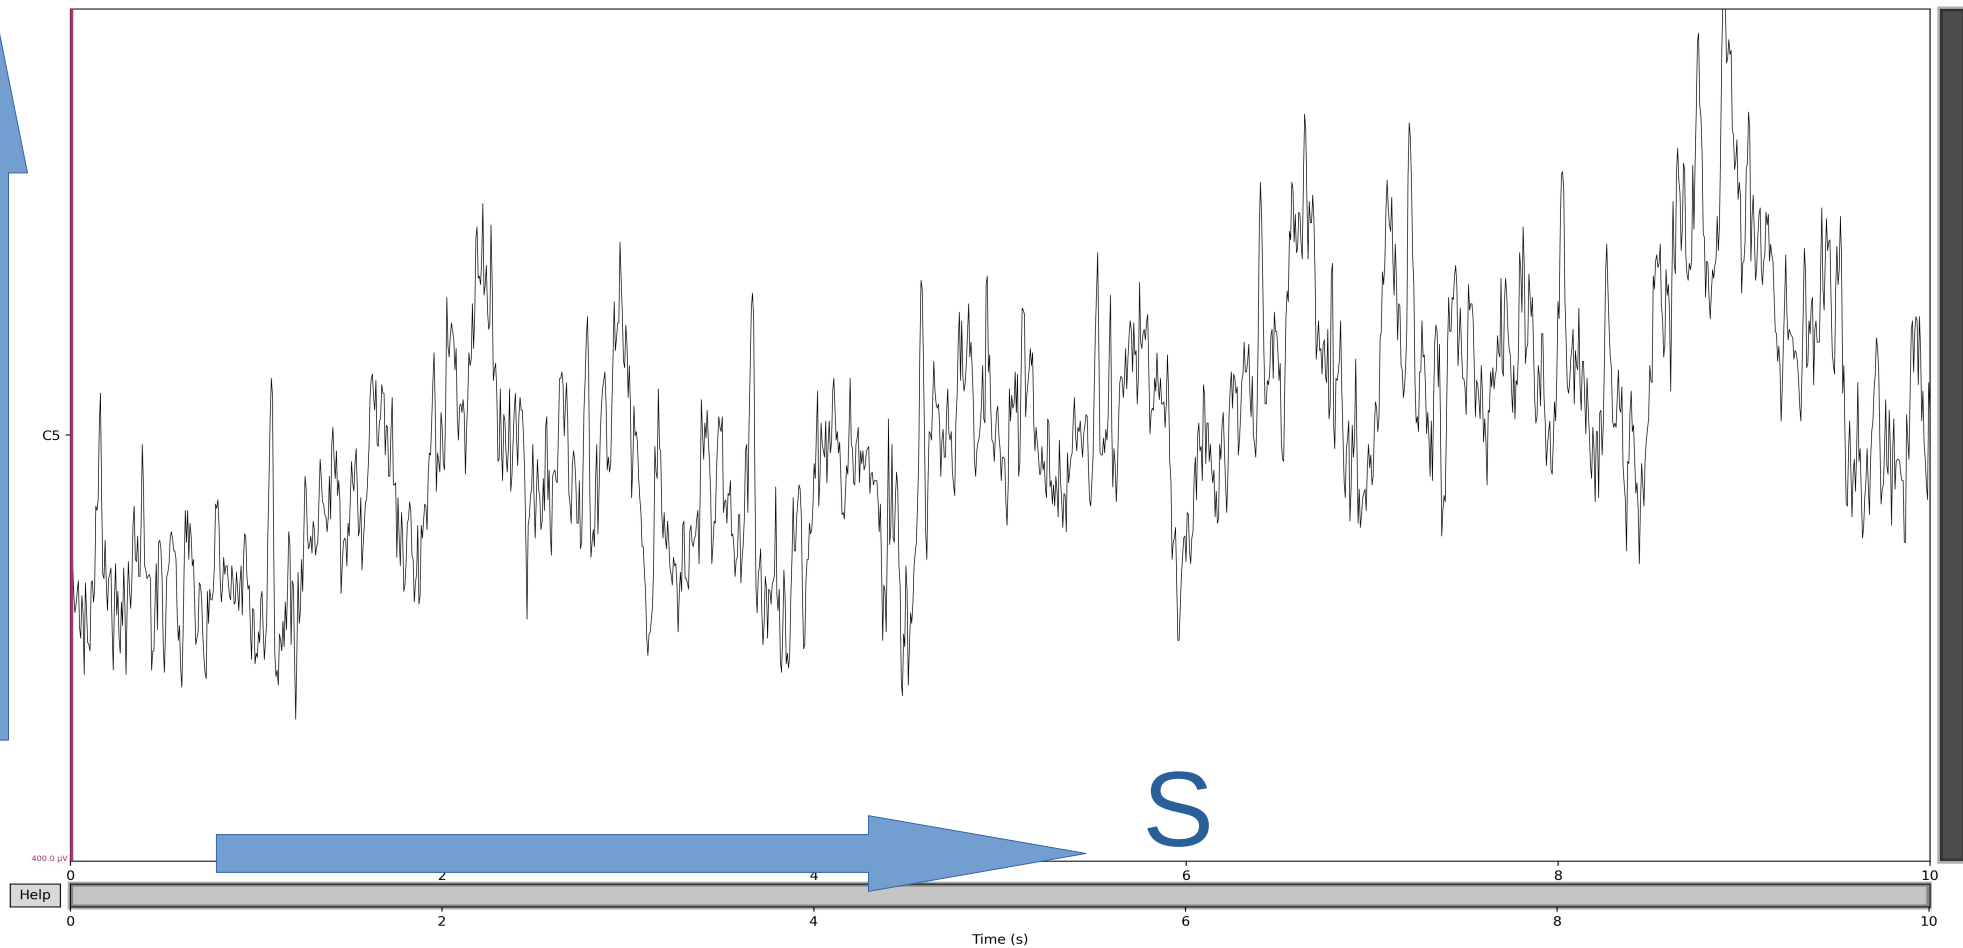

- Introduction to electroencephalography (EEG)
- Data presentation
- Preprocessing and Analysis of EEG Data
- Machine Learning and Deep Learning classification

Electroencephalography

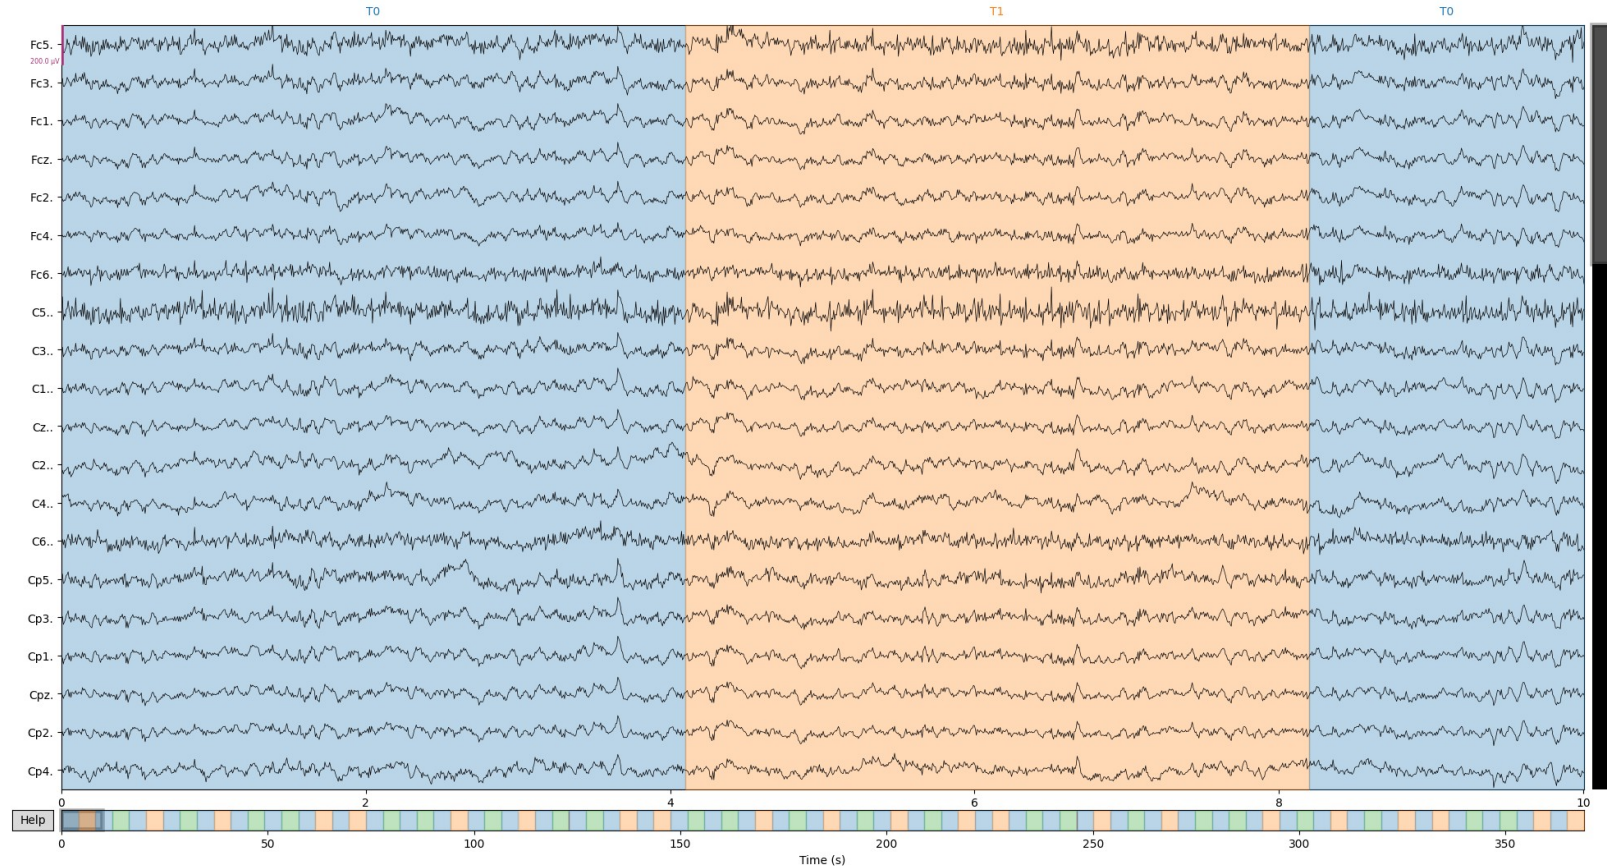

μV

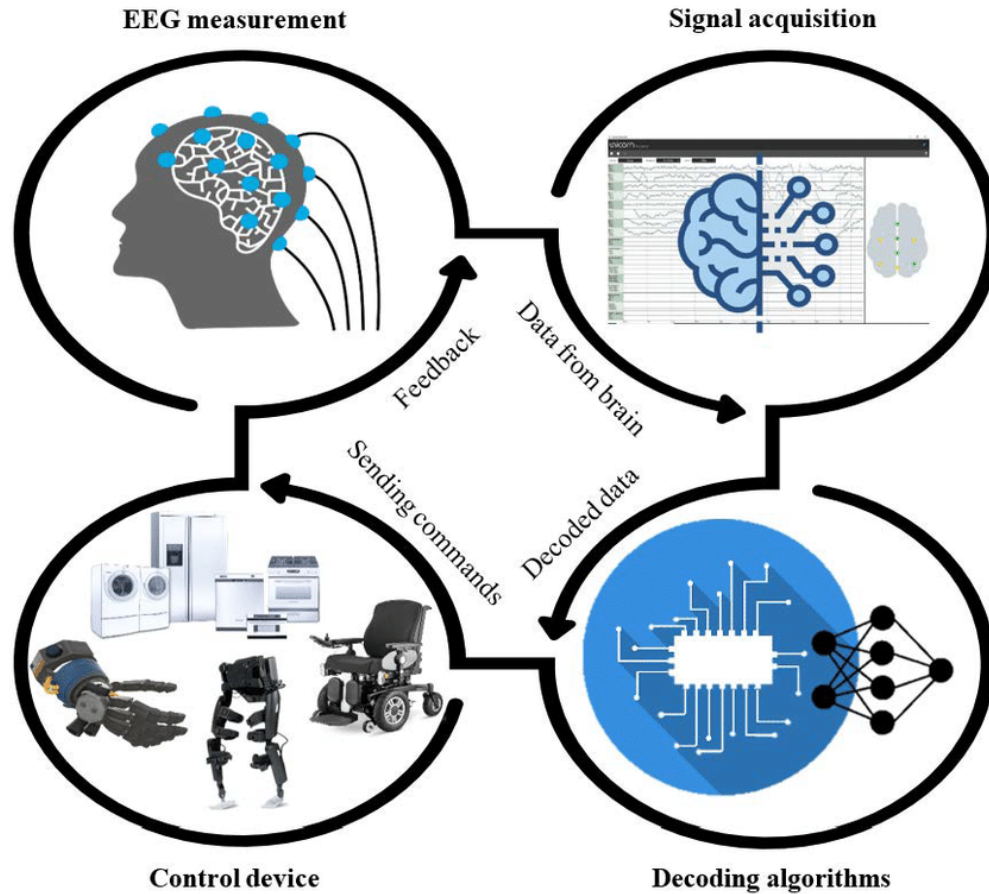

Electroencephalography

Electroencephalography

Brain-Computer Interface

EEG signals are A BIG MESS

Every electrode records:

- Brain activity
- Muscle activity (blinks, heart beats, movements)
- Electric activity (electronic tools, power system)

WE ARE ALL UNIQUE (DAMN!)

Different people can exhibit different brain activity patterns when performing the same task

DataSet

109 Subjects:

- 3 experiences per Subjects
- 2 minutes per experience
- 4 second visual signal: Open and close right or left fist

Objectives

- Clean the data from the noise and recognize the movement patterns
- Implement a model that recognize the action of the subject from its EEG

Preprocessing

- Filter the data frequencies
- Decompose the signals and eliminate artifacts (eye blinks, and muscle movements...)
- Change the reference of the signal

MEG + EEG ANALYSIS & VISUALIZATION

Filtering

Frequency of the
electricity system

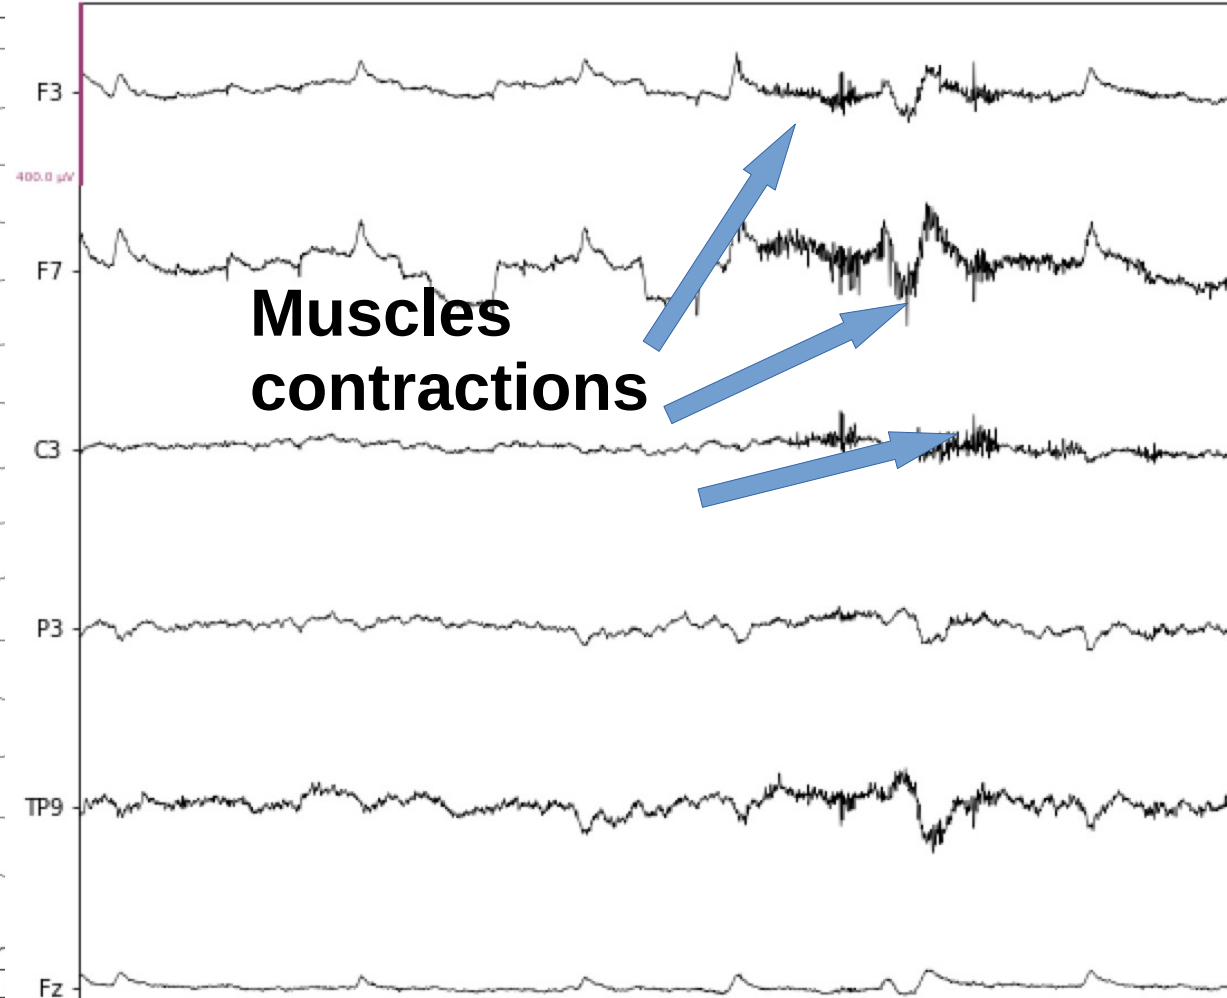

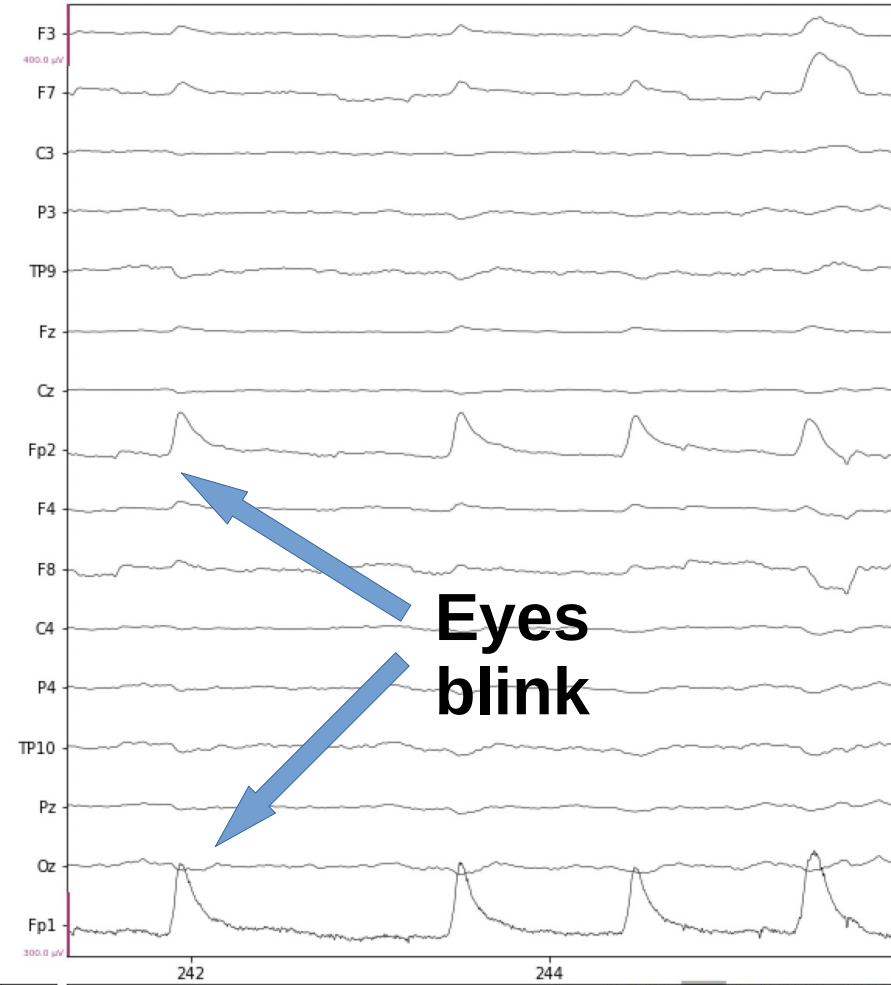

Original data

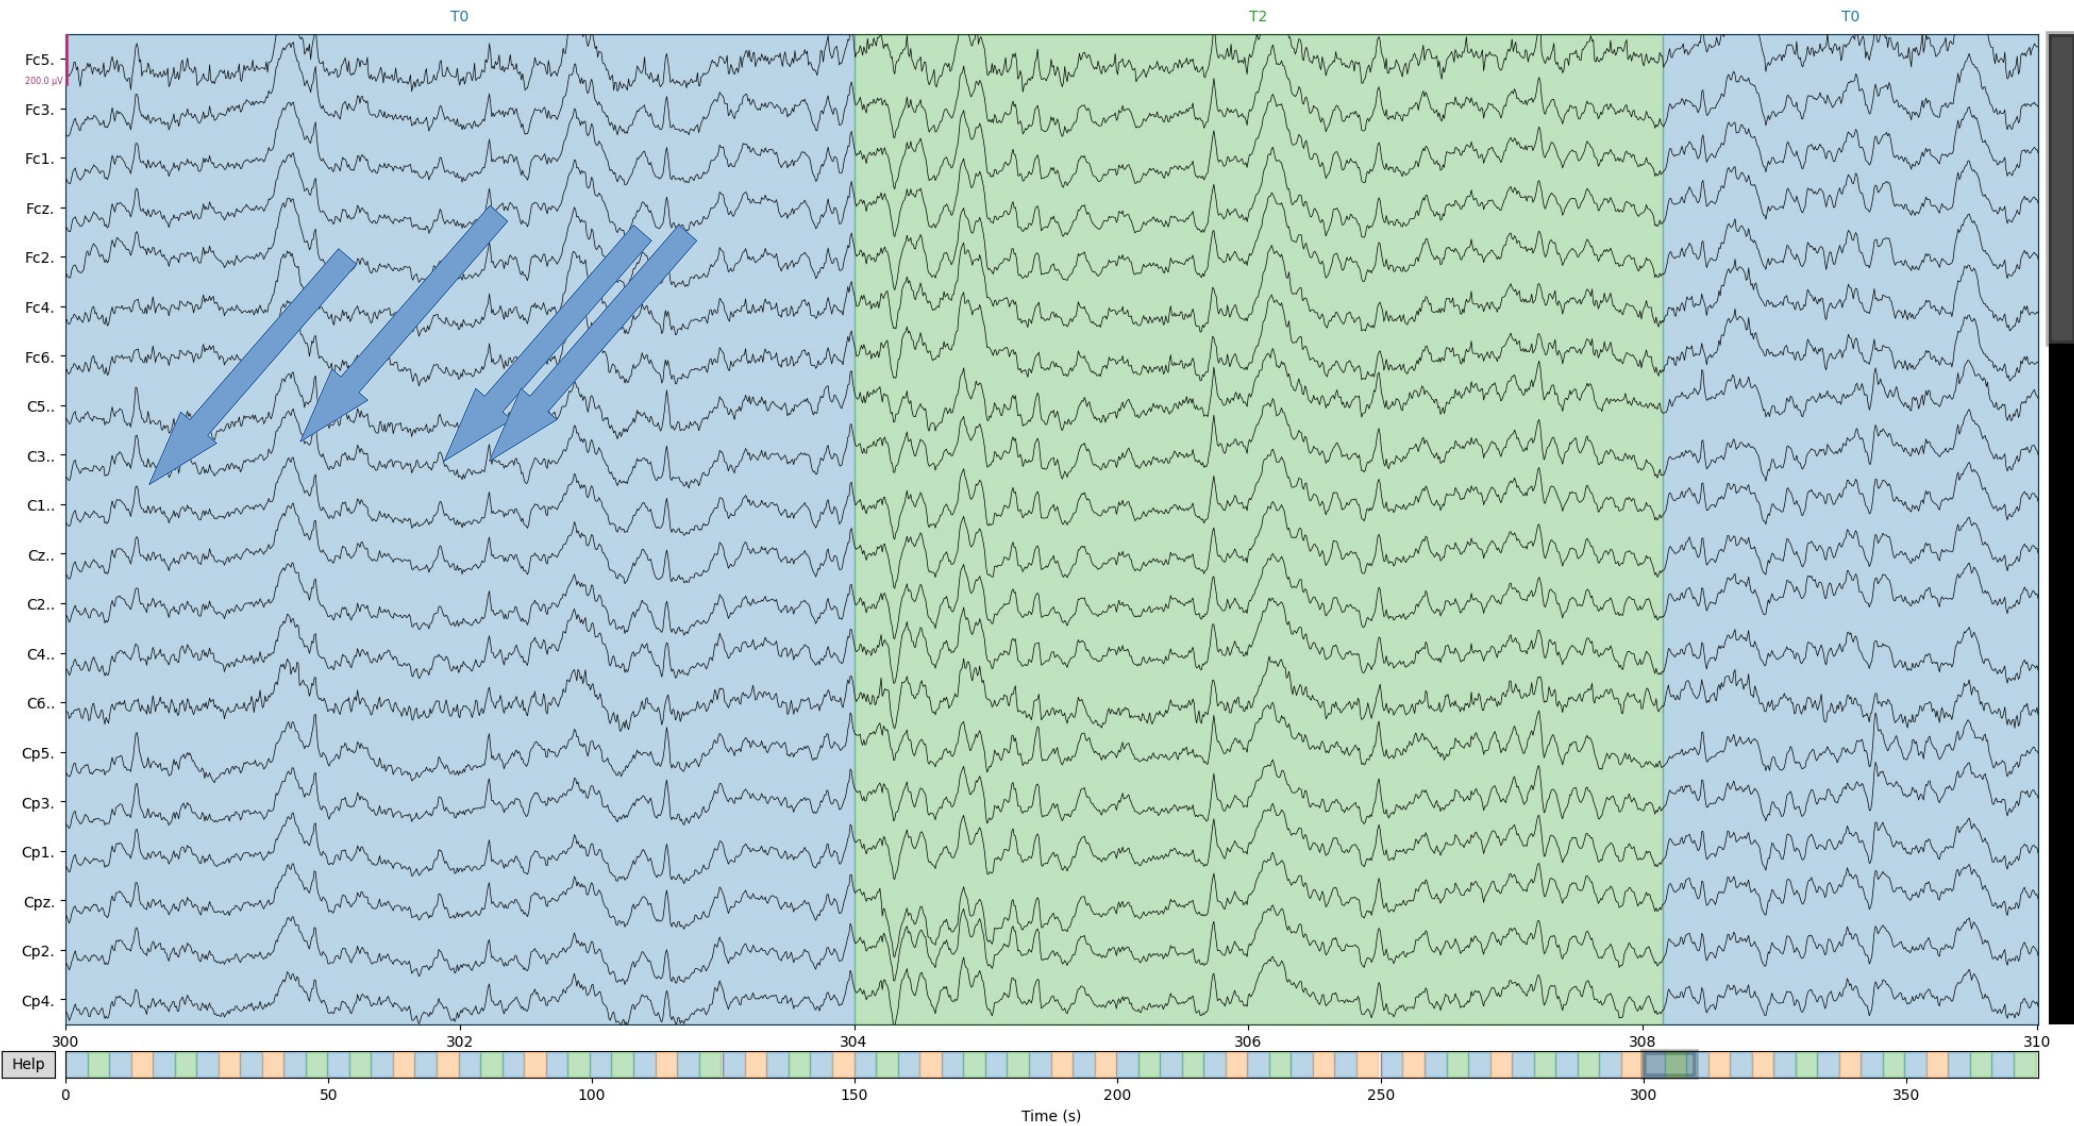

Filtered data, low_cut=0.5Hz, high_cut=30Hz

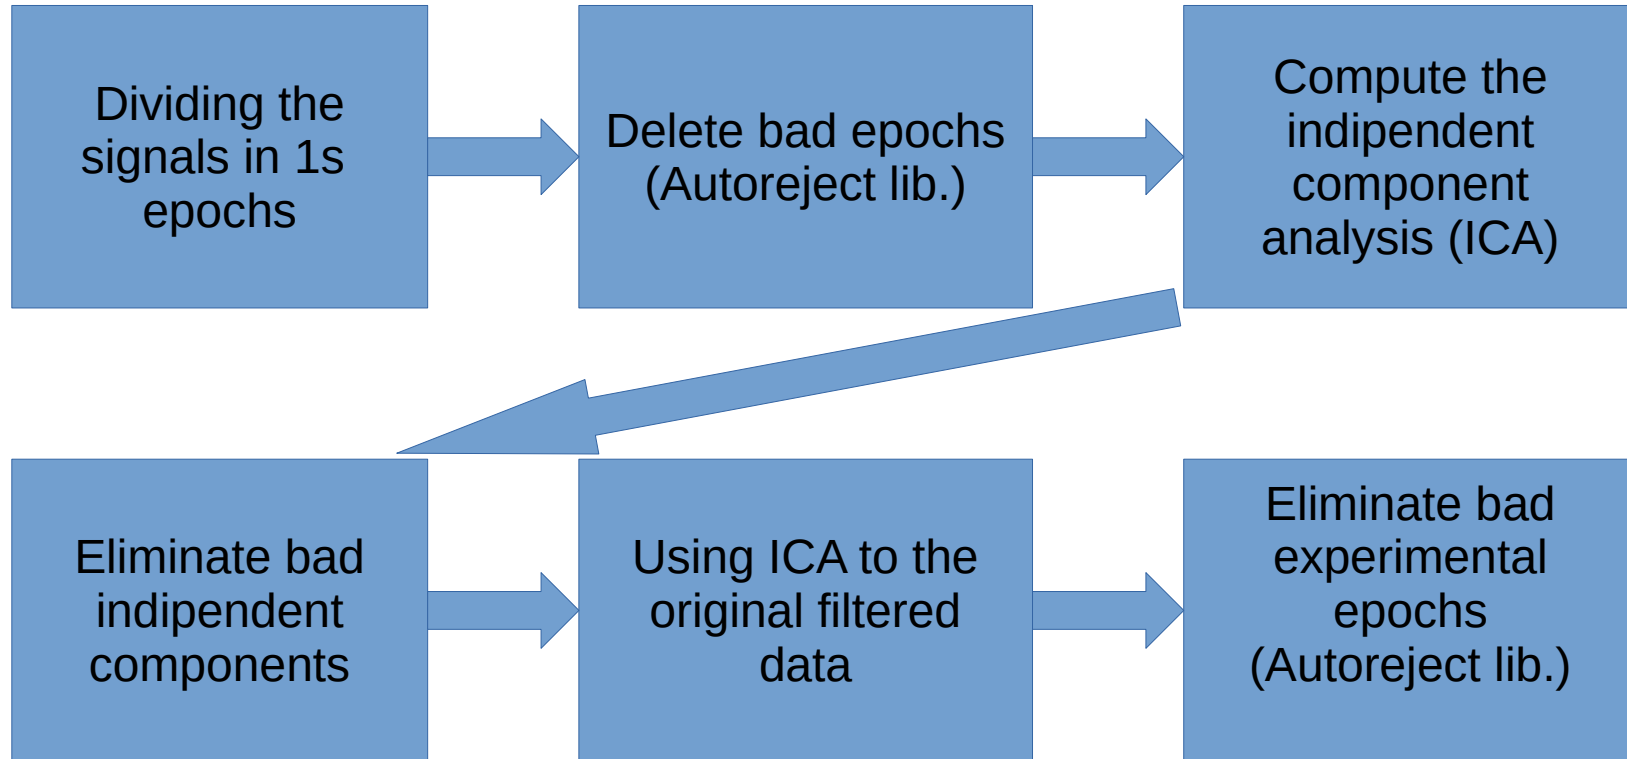

Artifacts detection

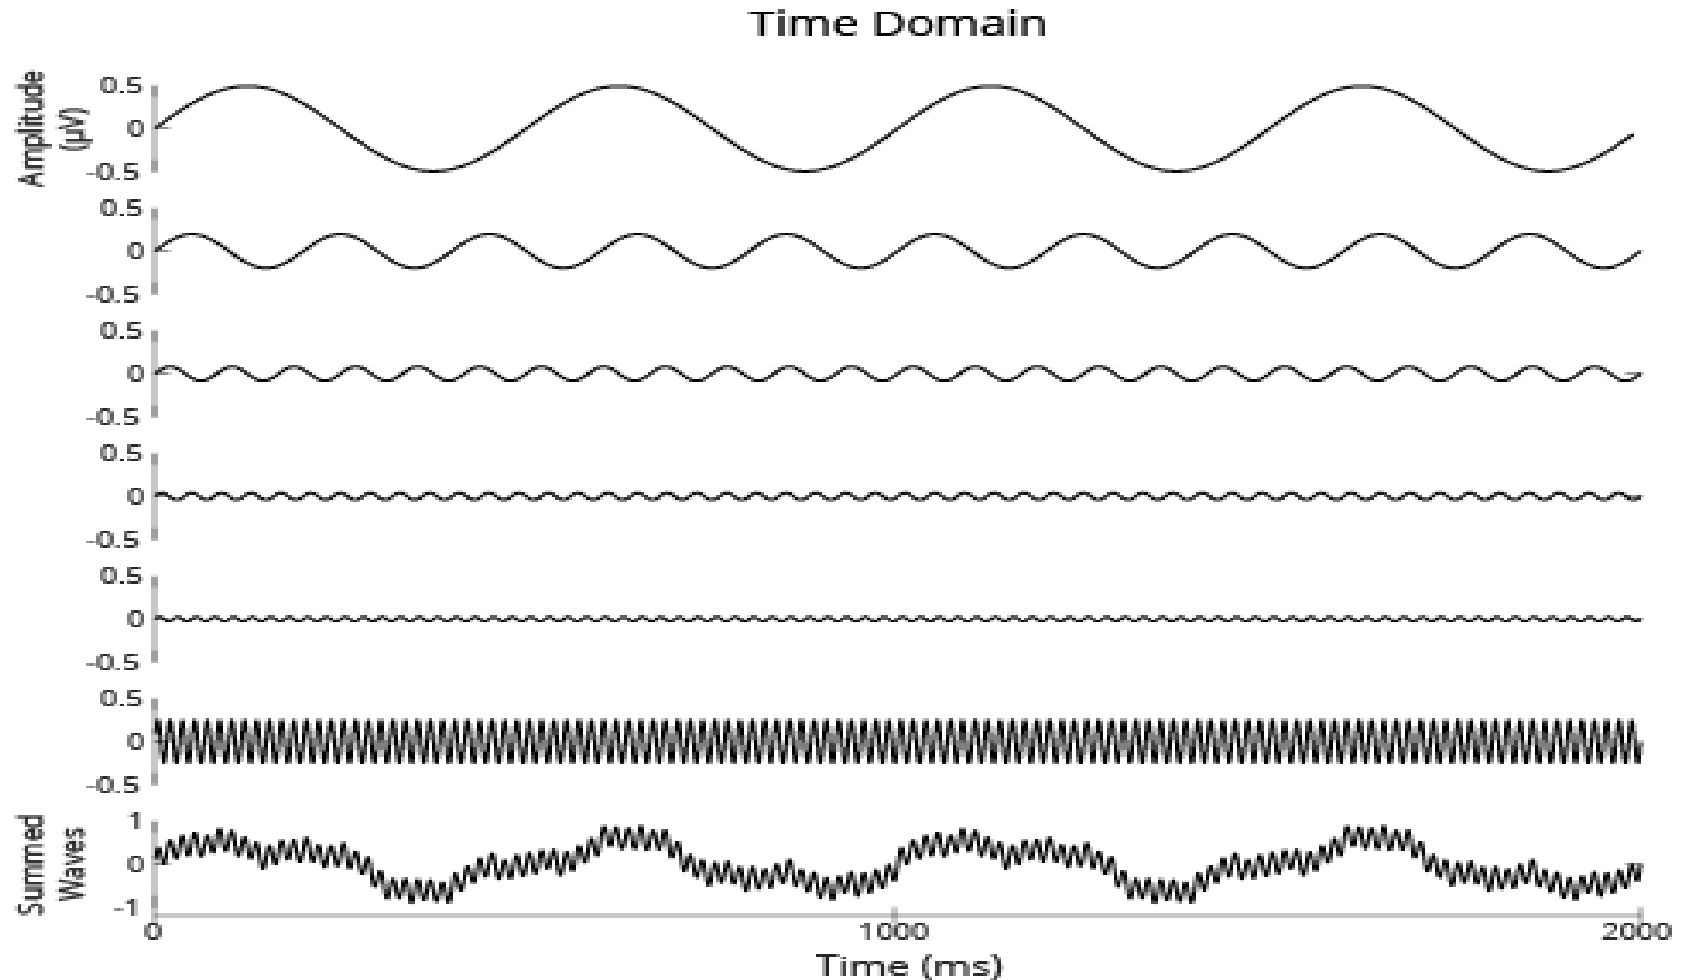

Automatic artifacts elimination

Indipendent component analysis

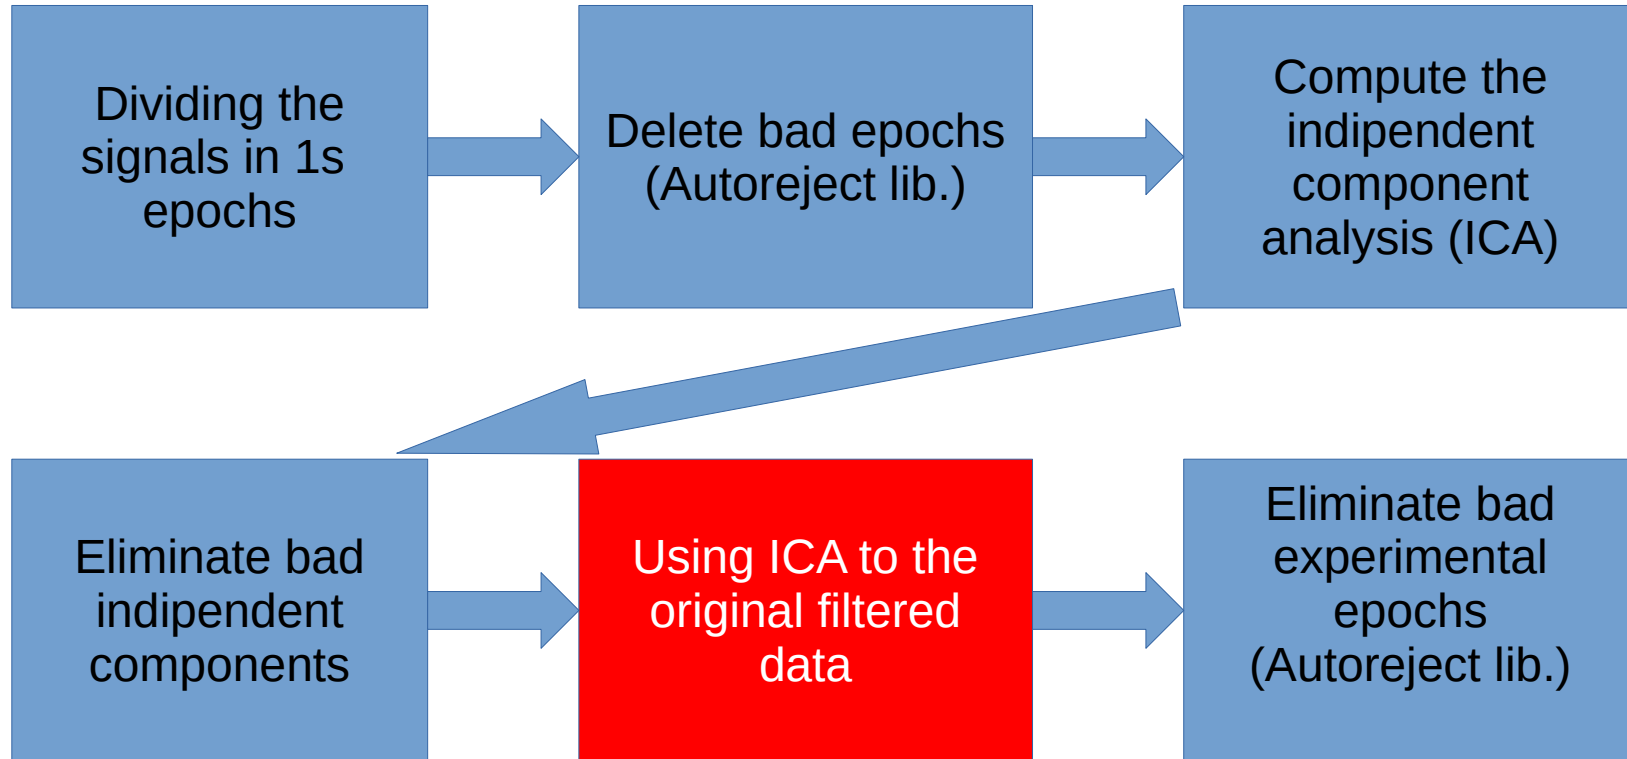

ICA components

Automatic artifacts elimination

Original signal

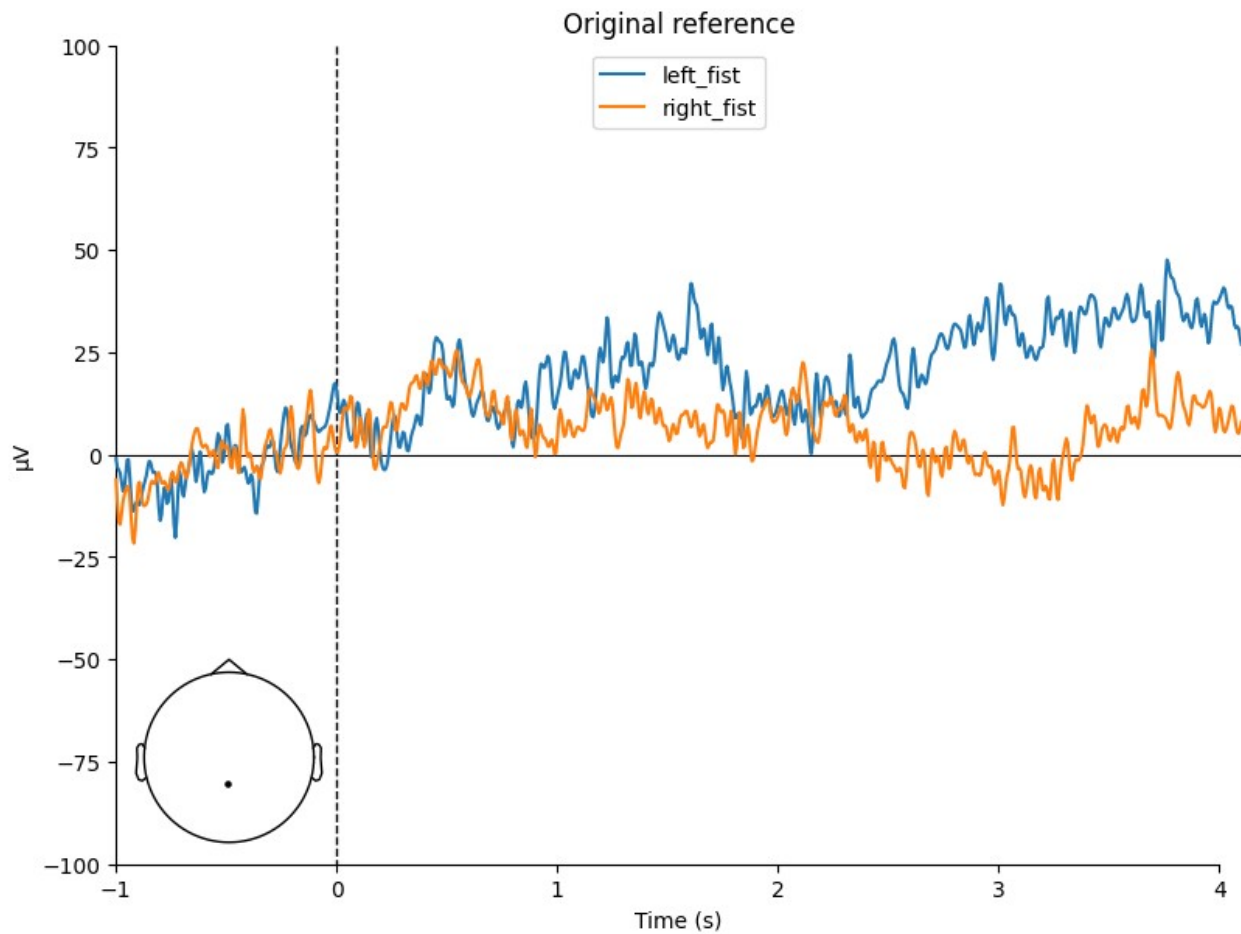

Decomposition using
the independent
components found
with ICA algorithm

Sum back the
components
we decide to
keep

Original Referece

Ears refractoring

Models

- Logistic Regression Model
- EEGNet (Convolutional Neural Network)

Limitations and difficulties

- Everything was new
- Heavy preprocessing
- A lot of data

What's next...

- Different filters
- Choose smaller sets of electrodes
- Try methods different than ICA to decompose the signals

THANK YOU!
